this book is organized into 4 sections each looking at the question of outcome prediction in cancer from a different angle the first section describes the clinical problem and some of the predicaments that clinicians face in dealing with cancer amongst issues discussed in this section are the tnm staging accepted methods for survival analysis and competing risks the second section describes the biological and genetic markers and the rôle of bioinformatics understanding of the genetic and environmental basis of cancers will help in identifying high risk populations and developing effective prevention and early detection strategies the third section provides technical details of mathematical analysis behind survival prediction backed up by examples from various types of cancers the fourth section describes a number of machine learning methods which have been applied to decision support in cancer the final section describes how information is shared within the scientific and medical communities and with the general population using information technology and the world wide applications cover 8 types of cancer including brain eye mouth head and neck breast lungs colon and prostate include contributions from authors in 5 different disciplines provides a valuable educational tool for medical informatics

prediction models are important in various fields including medicine physics meteorology and finance prediction models will become more relevant in the medical field with the increase in knowledge on potential predictors of outcome e g from genetics also the number of applications will increase e g with targeted early detection of disease and individualized approaches to diagnostic testing and treatment the current era of evidence based medicine asks for an individualized approach to medical decision making evidence based medicine has a central place for meta analysis to summarize results from randomized controlled trials similarly prediction models may summarize the effects of predictors to provide individu ized predictions of a diagnostic or prognostic outcome why read this book my motivation for working on this book stems primarily from the fact that the development and applications of prediction models are often suboptimal in medical publications with this book ihope to contribute to better understanding of relevant issues and give practical advice on better modelling strategies than are nowadays widely used issues include a better predictive modelling is sometimes easily possible e g a large data set with high quality data is available but all continuous predictors are dich omized which is known to have several disadvantages

medical risk prediction models with ties to machine learning is a hands on book for clinicians epidemiologists and professional statisticians who need to make or evaluate a statistical prediction model based on data the subject of the book is the patient s individualized probability of a medical event within a given time horizon gerds and kattan describe the mathematical details of making and evaluating a statistical prediction model in a highly pedagogical manner while avoiding mathematical notation read this book when you are in doubt about whether a cox regression model predicts better than a random survival forest features all you need to know to correctly make an online risk calculator from scratch discrimination calibration and predictive performance with censored data and competing risks r code and illustrative examples interpretation of prediction performance via benchmarks comparison and combination of rival modeling strategies via cross validation
